Description

Hello, I am hoping someone can assist me.

I have setup an Openfire server in Windows that is working. I can connect from another Windows client (pidgin) with no problems.

With Beem on Android Samsung Galaxy 3, I cannot connect. I am able to create an account on the Openfire server or use an existing account already setup on the server.

But in both cases, when it tries to connect, all I get is a failure to connect due to bad username or password.

I have uninstalled twice hoping there was some strange config error.

I am able to connect using Xabber client on the same Android device, so I know it is not the device that is not working.

If there is a bug, I hope I have explained it suitably.
